Dear Mr. Summers:

Subject: Transmittal of the Report "Thornton Composite Reservoir Groundwater Monitoring Report Fourth Quarter 2020"

Please find attached the report entitled "Thornton Composite Reservoir Groundwater Monitoring Report Fourth Quarter 2020" transmitted electronically. The report is prepared for transmittal to the Illinois Environmental Protection Agency (IEPA) in accordance with the Thornton Composite Reservoir Groundwater Monitoring Plan. Also attached is the Excel spreadsheet of the Thornton Composite Reservoir raw data as required by the IEPA.

If you have any questions or would like to have additional information, please contact Mr. Benjamin Morgan at (708) 588-3743 or morganb@mwr.org.

Very truly yours,

Albert E. Cox, Ph.D.
Environmental Monitoring and Research Manager
Monitoring and Research Department

EC	Electrical Conductivity
GMP	Groundwater Monitoring Plan
GPS	Groundwater Protection System
IAC	Illinois Administrative Code
TCR	Thornton Composite Reservoir
TDS	Total Dissolved Solids
TOC	Total Organic Carbon

ACKNOWLEDGMENT

This report for the Thornton Composite Reservoir Groundwater Monitoring was generated by the Monitoring and Research Department. All samples were collected by A3 Environmental Consultants (contractor) under the Thornton Composite Reservoir Contract 20-100-11. Analyses were performed by the Analytical Laboratories Division and the Analytical Microbiology Laboratory of the Metropolitan Water Reclamation District of Greater Chicago (District). Special thanks are due to Ms. Coleen Maurovich for typing and formatting this report.

DISCLAIMER

Mention of proprietary equipment and chemicals in this report does not constitute endorsement by the District.

INTRODUCTION

A Groundwater Protection System (GPS) was constructed for the Thornton Composite Reservoir (TCR) to protect against the exfiltration of combined sewer overflow (CSF) into the surrounding dolomite aquifers. The CSF and minimal amounts of stormwater are stored in the reservoir during and after large storm events. To monitor the performance of the GPS, a network of monitoring wells located outside the perimeter of the GPS is being monitored as discussed in the Revised Groundwater Monitoring Plan (GMP) (Black & Veatch, 2016). As explained in the Revised GMP, one sample of reservoir water, one from the Main Quarry Sump, and one from each of the seven wells are collected annually and analyzed for the Illinois Administrative Code (IAC) Title 35 Part 620 Class I groundwater constituents. In addition, following a reservoir fill event or during a routine quarterly event, groundwater is sampled from the seven wells and the Main Quarry Sump and tested for a targeted list of parameters that are more likely to be detected in CSF water.

The monitoring well system consists of one deep well, TB-124, which monitors the underlying Galena Aquifer, and six vertical Westbay multi-level monitoring wells: TB-118, TB-119, TB-120, TB-121, TB-122, and TB-123, which monitor the Silurian Dolomite aquifers. As discussed in the Revised GMP, following a reservoir fill event, bi-weekly sampling is required while the water in the reservoir remains above an elevation of -280 ft Chicago City Datum (CCD). Groundwater is sampled from each well at the first sample interval port immediately below the reservoir water elevation. Each of the multi-level monitoring wells is capable of monitoring four distinct 20-ft intervals in the Silurian Dolomite aquifer.

The locations of monitoring wells, the quarry sump, the TCR, and the GPS are presented in [Figure 1](#). The Main Quarry Sump is located beyond the south boundary of the GPS and is not a component of the TCR but is an integral part of the Hanson Material Services mining quarry to the south of the TCR. This sump facilitates mining operations by minimizing the water level at the bottom of the quarry. It is possible that the bottom of this sump could extend beyond the lowest depth of the TCR (-297.5 ft CCD). The sump contains mainly groundwater and small quantities of surface runoff, and it is sampled quarterly and during fill events, along with the wells, to evaluate the potential migration of contaminants from the TCR to the sump.

[Table 1](#) lists the characteristics of all wells at the TCR site (well location coordinates, elevations and depths, and the sampling port interval elevations).

Prior to the TCR becoming operational in November 2015, eight (8) sampling events were conducted on a quarterly basis for two years (May 2012 through March 2014) to provide background data on the existing groundwater quality. In order to evaluate the effectiveness of the grout curtain and the GPS, the Revised GMP (2016) presents the analysis of data for all samples collected during the background monitoring period and provides a baseline for comparison with routine monitoring data. Changes over time in groundwater calcium and magnesium concentrations would also be useful in tracking the occurrence of infiltration/exfiltration. Groundwater analytical data routinely generated for the monitoring wells, reservoir, and sump will also be compared with the IAC Title 35 Part 620 Class I Groundwater Standards (IPCB, IEPA, 2013) to evaluate any exceedances in groundwater standards.

¹Illinois State Plane Coordinate System (NAD 1927).

²Chicago City Datum (CCD).

There were two fill events during the fourth quarter of 2020. The first event (the fourth event of 2020) began on October 24 and lasted one day. The annual monitoring event was conducted in place of this fill event sampling. One complete set of samples was collected during October 26 – November 4, 2020, at the Reservoir, the Main Quarry Sump, and all monitoring wells. The second fill event during the quarter (the fifth event of 2019) began on December 14 and lasted two days. One complete set of samples was collected during December 15 – 18, 2020, at the Main Quarry Sump and all monitoring wells.

This report presents field activities, observations, and analytical data for surface and groundwater monitoring samples taken at the Main Quarry Sump, the TCR, and at all monitoring wells during the annual monitoring event from October 26 – November 4, 2020, and at the Main Quarry Sump and at all monitoring wells during fill event sampling conducted from December 15 – 18, 2020.

FIELD ACTIVITIES

For this report period, one complete set of samples for the annual monitoring event was collected at the TCR, the Main Quarry Sump, the deep well, and at sampling port interval 3 of all multi-level wells from October 26 – November 4, 2020. One complete set of fill event samples was collected at the Main Quarry Sump, the deep well, and at sampling port interval 3 of all multi-level wells from December 15 – 18, 2020. Sample collection dates are shown in Table 2.

Using a WTW Multi 3400i pH/conductivity/temperature meter, the pH, electrical conductivity (EC), and temperature of each sample were measured and recorded immediately after collection.

Prior to sampling the multi-level wells, hydrostatic pressure was measured to calculate the groundwater elevation at Port 3 of each well. Table 3 lists the elevations at Port 3 of each well and the corresponding groundwater elevations during the annual monitoring event in October and during fill event sampling in December 2020.

All samples were packed in ice and shipped to the District's Analytical Laboratories Division for the analysis of selected inorganic constituents (IAC Title 35 Part 620 Class I Groundwater Standards) in accordance with the revised GMP. Additional aliquots were also prepared in the field and shipped in ice to the District's Analytical Microbiology Laboratory for fecal coliform analysis. For the annual monitoring event, an additional set of aliquots was prepared in the field and shipped in ice to a contract laboratory for analysis of selected organic constituents (IAC Title 35 Part 620 Class I Groundwater Standards) in accordance with the revised GMP.

TABLE 2: DEVICES AND CORRESPONDING DATES OF SAMPLING DURING THE ANNUAL MONITORING EVENT IN OCTOBER AND FILL EVENT SAMPLING IN DECEMBER 2020

Date of	Event	Device/Structure Sampled

5	12/18/2020	TB-124	NA	-338

¹Chicago City Datum.

²No data available. Pressure readings could not be made at ports in this well.

³TB-124 is a conventional well screened from -663 to -698 ft CCD. Samples were taken at approximately 650 ft below ground surface once during the annual monitoring event sampling in October 2020 and during the fill event in October and December 2020.

⁴NA = Not Applicable.

ANALYTICAL RESULTS

Table 4 lists the analytical methods used by the laboratory for measured parameters. Analytical results were reviewed to identify any analytes that exceeded the Illinois Class I Groundwater Standards (35 IAC Part 620).

The analytical data for all well samples, the Main Quarry Sump, and the TCR collected during the annual monitoring event from October 26 – November 4 are presented in Table 5. There were a few exceedances of the Part 620 groundwater standards, including pH, total dissolved solids (TDS), chloride, sulfate, and boron, as indicated in bold font in Table 5. Among these parameters, only pH showed a value higher than the background maximum.

Almost all organic parameters were undetectable in the annual monitoring samples from wells and the Main Quarry Sump (Table 5). Only Benzo[a]anthracene and Benzo[b]pyrene were detected above their Class I Groundwater Standards in any well or in the Main Quarry Sump. For Mecoprop, 1,4-Dioxane, Benzo[a]anthracene, Benzo[k]fluoranthene, and Bis (2-ethylhexyl) phthalate, the lab reporting limit was higher than the Class I Groundwater Standard for at least one analysis of groundwater from a well or the Main Quarry Sump. The maximum lab reporting limits for RDX (cyclonite) and Bis(2-ethylhexyl)phthalate were also higher than their background maximum concentrations (0.00021 and 0.0052 mg/L, respectively).

The analytical data for all well samples and the Main Quarry Sump sample collected during fill event monitoring from December 15 – 18 are presented in Table 6. There were a few exceedances of the Part 620 groundwater standards, including pH, TDS, chloride, sulfate, boron, and zinc, as indicated in bold font in Table 6. Among these parameters, only pH showed a value higher than the background maximum.

There was no detection of fecal coliform bacteria in any well or in the Main Quarry Sump during either the annual monitoring event or fill event sampling (Tables 5 and 6).

¹Lab reporting limit. Where analyses for the same parameter had different RL, the maximum RL is shown.

²Duplicate sample.

³No existing limit.

⁴For well and sump samples only, concentrations in bold font indicate their exceedance of Part 620 Class 1 Groundwater Standards.

⁵No data reportable. Reservoir sample contained too much particulate matter for accurate measurement with field pH/EC meter.

⁶Below reporting limit in background monitoring samples.

⁷Not determined.
